JC17 Rec'd PCT/PTO 24 JUN 2005

Preliminary Amendment
Attorney Docket No. 052667

AMENDMENTS TO THE CLAIMS

The following listing of claims replaces all prior versions of claims in the application.

1. (Currently amended): A ~~spherical particle for use in producing a bulk Fe-based sintered alloy soft magnetic material of metallic glass, comprising:~~

~~a Fe-based metallic glass alloy prepared by sintering, in a temperature range of 573 K to the crystallization temperature (Tx), spherical particles of Fe-based metallic glass alloy prepared by an atomizing process, which has: the spherical particles having a particle size of 30 to 125 µm; a composition consisting of, by atomic %, 0.5 to 10 % of Ga, 7 to 15 % of P, 3 to 7 % of C, 3 to 7 % of B and 1 to 7 % of Si, with the remainder being Fe; a crystallization temperature (Tx) of 770 to 800 K; and a liquidus temperature (Tl) of 1220 to 1300 K,~~

~~wherein the Fe-based sintered alloy soft magnetic material has metallic glass phase of high-density with a relative density of 99.0 % or more, a magnetic permeability of 3900 (μmax) or more, a coercive force (Hc) of 19 (A/m) or less and a specific resistance of 1.6 $\mu\Omega\text{m}$ or more in an as-sintered state,~~

~~wherein the Fe-based sintered alloy soft magnetic material has a temperature interval of a supercooled liquid region (ΔTx) of 25 K or more, as expressed by a formula: $\Delta\text{Tx} = \text{Tx} - \text{Tg}$, wherein Tx is a crystallization temperature, and Tg is a glass transition temperature; and a reduced glass transition temperature of 0.59 or more, as expressed by a formula: Tg/Tl , wherein Tg is a glass transition temperature, and Tl is a liquidus temperature.~~

2. (Canceled)

Preliminary Amendment
Attorney Docket No. **052667**

3. (Currently amended): A bulk Fe-based sintered alloy soft magnetic material of metallic glass, prepared by subjecting the bulk Fe-based sintered alloy soft magnetic material as defined in claim [[2]] 1 to a heat treatment in a temperature range of 573 to 723 K, which has a magnetic permeability of 7000 (μ max) or more and a coercive force (Hc) of 12 (A/m) or less.

4. (Currently amended): A method of producing ~~the spherical particle as defined in claim 1~~ Fe-based sintered alloy soft magnetic material, comprising:

preparing molten alloy having a composition consisting of, by atomic %, 0.5 to 10 % of Ga, 7 to 15 % of P, 3 to 7 % of C, 3 to 7 % of B and 1 to 7 % of Si, with the remainder being Fe; dropping or ejecting said molten alloy from a nozzle; and spraying high-speed gas to droplets of said molten alloy to rapidly solidify said droplets to obtain a Fe-based metallic glass alloy particle having an amorphous phase and a maximum particle size of 30 to 125 μm , thereby obtaining a plurality of spherical particles of Fe-based metallic glass alloy; and

sintering said spherical particles by a spark plasma sintering process under the conditions that: a heating rate is set at 40 K/min or more; a sintering temperature (T) is set at 573 K or more and within a temperature range satisfying a relationship of $T < T_x$, wherein T_x is a crystallization temperature; and a sintering pressure is set at 200 MPa or more.

5. (Canceled)

Preliminary Amendment
Attorney Docket No. **052667**

6. (Currently amended): A method of producing [[the]] bulk Fe-based sintered alloy soft magnetic material of metallic glass as defined in claim 4, the method further comprising: preparing a Fe-based sintered alloy soft magnetic material by the method as defined in claim 5; and subjecting said Fe-based sintered alloy soft magnetic material to a heat treatment in a temperature range of 573 to 723 K.
